

Write-up for the Meow box found on hack the box.

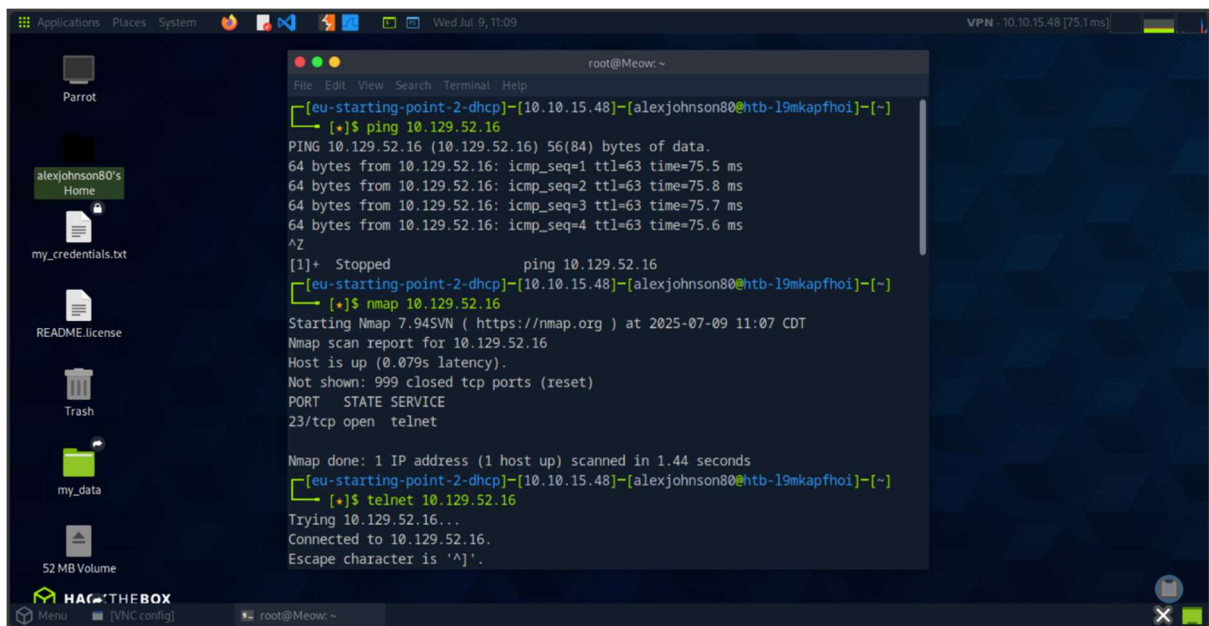

First, started the pwnbox directly from HTB using a working server.

A couple of question were asked based on the task . I answered it correctly.

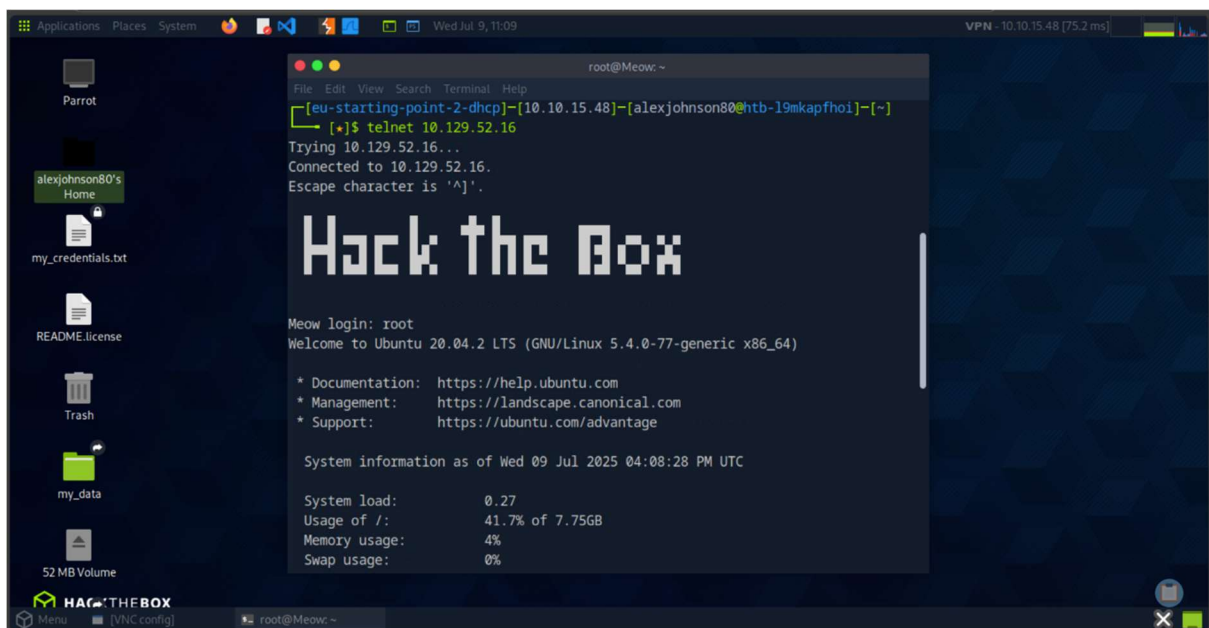

After pwning the machine we got the target IP and access to pwnbox which was inbuilt with parrot OS.

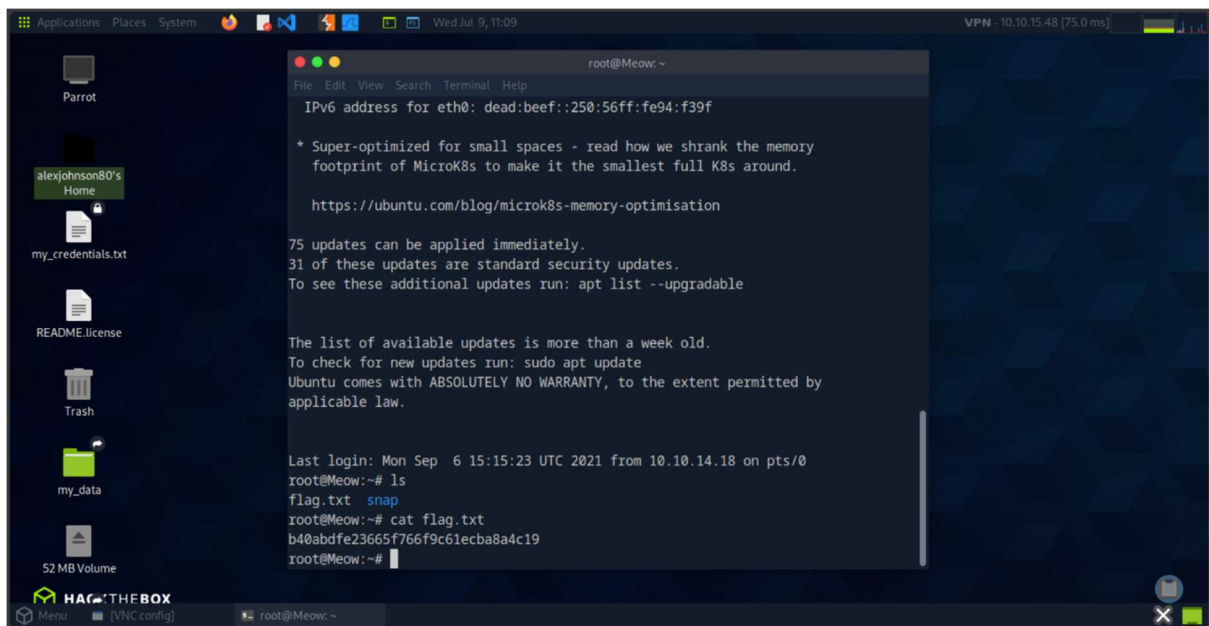

Opened the desktop and open the terminal :

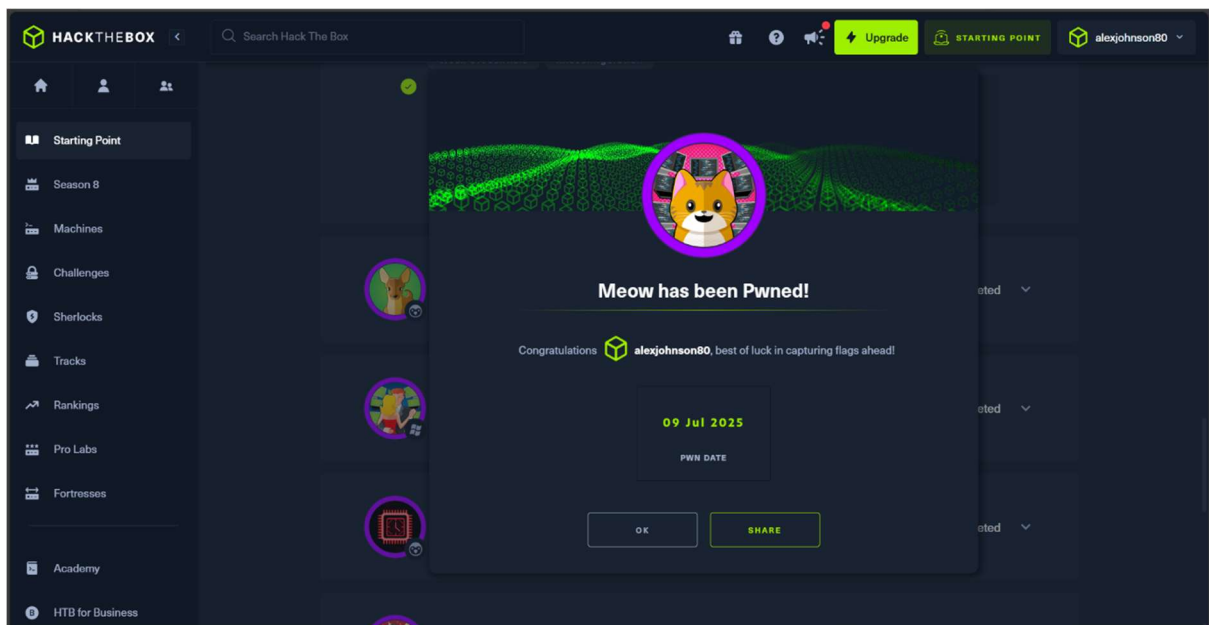

- Ping the port address .
- Used nmap for scanning and enumeration purposes.
- Telnet is used.

Logged in to the system using “ root ”. Then listed out the files in the system and open flag.txt file using “ cat flag.txt ”.

Flag found

And successfully completed this Meow and has been pwned!.
