# TASK - 6

- Launch GoPhish: Open the GoPhish application from the Kali Linux menu and log in using the default "admin" username and "gophish" password. You will be prompted to create a new password upon the first login .
- Set up a Sending Profile: Create a sending profile, for example, using a Gmail account. This involves generating an "app password" in your Google account settings to use for the SMTP server, port, and username in GoPhish .
- Create a Landing Page: Clone a page, like a Gmail login page, and paste the HTML source into GoPhish. Configure it to capture submitted data and passwords before redirecting the user to the legitimate page .
- Design an Email Template: Import an email template from an existing email, such as a two-step verification notification. Ensure you select the option to "change links to point to landing page" .
- Add Users and Groups: Manually add or import a list of target users and groups for the phishing campaign .
- Launch the Campaign: Start the campaign by selecting the email template, landing page, and user group you created earlier .
- Monitor Results: View the campaign dashboard to see real-time data, including the number of emails sent, opened, links clicked, and submitted credentials .
